## Rotate each shape. Answer as the new coordinates.

## Answers

$\theta=$ Angle of Rotation

## Rotation Formula

$\mathrm{x} 1=\mathrm{x} \times \cos (\theta)-\mathrm{y} \times \sin (\theta)$
$y 1=x \times \sin (\theta)+y x \cos (\theta)$
In the example to the right the shape is at coordinates $(1,4)$.
Lets find the coordinates if we rotated the shape $60^{\circ}$.

1. $\mathrm{x} 1=1 \times \cos (60)-4 \times \sin (60)$ $\mathrm{y} 1=1 \times \sin (60)+4 \times \cos (60)$
2. $\mathrm{x} 1=1 \times 0.5-4 \times 0.87$ $\mathrm{y} 1=1 \times 0.87+4 \times 0.5$
3. $\mathrm{x} 1=0.5-3.48$
$\mathrm{y} 1=0.87+2$
4. $x 1=-2.98$
$\mathrm{y} 1=2.87$
5. Looking at shape, we can see that rotated $60^{\circ}$ it is at $(-2.98,2.87)$.
1) Rotate the shape $-282^{\circ}$ around the point $(0,0)$.
